

Aim:- Write a PL/SQL Code Using Basic Variable, Anchored declarations, and usage of Assignment operation PL/SQL

INTRODUCTION.

PL/SQL stands for procedural language extension of SQL. PL/SQL is a combination of SQL along with the procedural features of programming languages. It was developed by Oracle Corporation in the early 90's to enhance the capabilities of SQL.

Oracle uses a PL/SQL engine to process the PL/SQL statements. A PL/SQL Code can be stored in the Client system (Client side) or in the database (Server-side).

Advantages of PL/SQL:

- Block structures: PL/SQL consists of blocks of code, which can be nested within each other. Each block forms a unit of a task or a logical module. PL/SQL block can be stored in the database and reused.
- Procedural language Capability:- PL/SQL consists of procedural language constructs such as conditional statements (if else statements) and loops like (For loops).
- Better Performance: PL/SQL engine processes multiple SQL statements simultaneously as a single block, thereby reducing network traffic.
- Error Handling: PL/SQL handles errors or exceptions effectively during the execution of a PL/SQL program.

Once an exception is caught, specific actions can be taken. an exception is caught, specific actions can be taken depending upon the type of the exception & it can be displayed to the user with a message.

Syntax of PL/SQL program:

Declare

Variable

declaration;

Begin

Executable statements;

end;

PL/SQL Variables Declaration

- To declare variables, you use a variable name followed by the data type and terminated by a semicolon (;).
- you can also explicitly add a length constraint to the data type within parentheses. The following illustrates.
- Some examples of declaring variables in a PL/SQL anonymous block:

DECLARE

n_employee_id number;

v_first_name varchar2(20);

d_hire_date date;

BEGIN;

NULL;

END;

In PL/SOL program, one of the most common tasks is to select values from columns in a table into a set of variables.

In case the data types of columns of the table changes, you have to change the PL/SOL program to make the types of the variables compatible with the new changes.

PL/SOL provides you with a very useful feature called Variable anchors. It refers to the use of the %TYPE keyword to declare a variable with the data type is associated with a column's data type of a particular column in a table.

```
DECLARE
n_employee_id EMP.EMPNO%TYPE;
v_first_name EMP.ENAME%TYPE;
d_hire_date EMP.HIREDATE%TYPE;
BEGIN
NULL;
END;
```

PL/SOL variable assignment: In PL/SOL, to assign a value to a variable to another, you use the assignment operator(:=) which is a colon(:) followed by the equal sign(=).

DECLARE

Experiment No. Regd. No.

```
n_employee_id EMP.EMPNO % TYPE;  
v_first_name EMP.ENAME % TYPE;  
d_hire_date EMP.HIREDATE % TYPE;  
BEGIN  
v_first_name := 'Balu';  
n_employee_id := 8000;  
d_hire_date := to_date('19960101', 'YYYYMMDD');  
END;  
/
```

```
SET SERVEROUTPUT ON SIZE 100000;  
DECLARE  
n_employee_id EMP.EMPNO % TYPE;  
v_first_name EMP.ENAME % TYPE;  
d_hire_date EMP.HIREDATE % TYPE;
```

```
BEGIN  
SELECT EMPNO, ENAME, HIREDATE INTO  
n_employee_id, v_first_name, d_hire_date FROM  
emp WHERE EMPNO = 7934;  
DBMS_OUTPUT.PUT_LINE('Employee details');  
DBMS_OUTPUT.PUT_LINE(n_employee_id);  
DBMS_OUTPUT.PUT_LINE(d_hire_date);  
END;
```

Output=

Employee details

7934

MILLER

23-JAN-82

Aims:- Write a PL/SOL Code Bind and Substitution variable printing in PL/SOL.

1. Substitution Variables

The clue here is the name "substitution". It relates to values being substituted into the code before it is submitted to the database.

These substitutions are carried out by the interface being used. In this example we're going to use SQL*plus as our interface.

```
create or replace function myth return varchar2 is
v_dname varchar2(20);
begin
  select dname into v_dname from dept where deptno =
  & p_deptno;
  return v_dname;
end;
```

Output:

SOL7

Enter value for p-deptno: 20

old F: where deptno = &p-deptno;

new F: where deptno = 20;

Write a PL/SQL block using SQL and Control structures in PL/SQL.
Conditional statements in PL/SQL:-

As the name implies, PL/SQL supports programming language features like conditional statements, iterative statements. The programming constructs are similar to how you see in programming languages like java and c++.

IF THEN ELSE STATEMENT:

1) IF Condition THEN Statement 1;

ELSE

Statement 2;

END IF;

2) IF Condition 1 THEN Statement 1; Statement 2;

ELSIF Condition 2 THEN

Statement 3; ELSE

Statement 4; END

Loops in PL/SQL:- There are three types of loops in SQL/PL.

1. simple loop

2. while loop

3. For loop.

Simple Loop: A simple loop is used when a set of statements is to be executed at least one before the loop terminates. An Exit Condition must be specified in the loop.

Syntax:

LOOP Exit: statements;
{or EXIT WHEN condition;}

2. while loop: A WHILE LOOP is used when a set of statements has to be executed as long as a condition is true. The condition is evaluated at the beginning of each iteration. The iteration until the condition becomes false.

Syntax:- WHILE <condition>

DO

OP

Statement

S; END

LOOP;

3. FOR LOOP: A FOR LOOP is used to execute a set of statements for a pre-determined no. of times. Iteration occurs b/w the start and end integer values given.

Syntax:

FOR Counter IN Val 1..Val 2

DO

OP

Statements;

END LOOP;

Experiment No. Regd. No. Example - I:

Write a PL/SQL program to find the Arithmetic operations by using if, else, if, else

```
SET SERVEROUTPUT ON
```

```
SET VERIFY OFF
```

```
DECLARE
```

```
a number(3) := &a;
```

```
b number(3) := &b;
```

```
ch number(3) := &ch;
```

```
r number(4);
```

```
BEGIN
```

```
IF ch=1 THEN
```

```
r := a+b;
```

```
DBMS_OUTPUT.PUT_LINE('Addition: '||r);
```

```
ELSIF ch=2 THEN
```

```
r := a-b; (# r=a-b;)
```

```
DBMS_OUTPUT.PUT_LINE('Subtraction: '||r);
```

```
ELSIF ch=3 THEN
```

```
r := a*b;
```

```
DBMS_OUTPUT.PUT_LINE('Multiplication: '||r);
```

```
ELSIF ch=4 THEN
```

```
r := a/b;
```

```
DBMS_OUTPUT.PUT_LINE('Division: '||r);
```

```
ELSIF ch=5 THEN
```

```
r := mod(a,b);
```

Experiment No.

Regd. No.

```
DBMS_OUTPUT.PUT_LINE('Remainder : '||r);  
ELSE  
  DBMS_OUTPUT.PUT_LINE('Invalid choice : ...');  
END IF;  
END;  
/
```

Eg-2: Write a PL/SQL Program on Simple Loop.

```
SET SERVEROUTPUT ON
```

```
SET VERIFY OFF
```

```
DECLARE
```

```
  i number(3);
```

```
  n number(3) := 8;
```

```
BEGIN
```

```
  i := 1;
```

```
  LOOP
```

```
    DBMS_OUTPUT.PUT_LINE(i);
```

```
    i := i + 1;
```

```
  EXIT WHEN i > n;
```

```
  END LOOP;
```

```
END;
```

```
/
```

Output:-

Enter value for a: 10

Enter value for b: 8

Enter value for ch: 1

Addition : 18.

Output:-

Enter value for n: 5

1

2

3

4

Experiment No. Regd. No.

Eg-3:- Write a PL/SQL program on while loop.

SET SERVEROUTPUT ON

SET VERIFY OFF

DECLARE

 i number(3);

 n number(3) := &n;

BEGIN

 i := 1;

 WHILE i <= n

 LOOP

 DBMS_OUTPUT.PUT_LINE(i);

 i := i + 1;

 END LOOP;

END;

/

Example-4 : Write a PL/SQL program on For loop.

SET SERVEROUTPUT ON

SET VERIFY OFF

DECLARE

 n number(3) := &n;

BEGIN

 FOR i IN 1..n

 LOOP

 DBMS_OUTPUT.PUT_LINE(i);

 END LOOP;

END;

/

Devineni Venkata Ramana & Dr. Hima Sekhar
MIC College of Technology

Output:-

Enter value for n: 3

1

2

3

Output:-

Enter value for n: 3

1

2

3
